EP 0 483 772 A1

FIELD OF THE INVENTION

The present invention relates to novel aminocoumaran derivatives or salts thereof and pharmaceutical compositions containing them as an active component. More specifically, the present invention relates to novel aminocoumaran derivatives or salts thereof and lipoperoxide formation inhibitory preparations containing them as an active component, which are useful as medicines for preventing and treating various diseases such as arterial sclerosis, hepatopathy, cerebrovascular diseases and the like.

BACKGROUND OF THE INVENTION

As it has become evident that the formation of a lipoperoxide in the body and a concomitant radical reaction have various harmful effects on the living body through membrane disorders, enzymatic disorders and the like, various attempts to use antioxidants and lipoperoxide formation inhibitors as medicines have been made. At present, the main lipoperoxide formation inhibitors used in the art are derivatives of natural antioxidants such as vitamin C, vitamin E and the like, and phenol derivatives (Kenji Fukuzawa, The Japanese Journal of Clinical Medicine, 46, 2269-2276, 1988). However, their fundamental structural skeletons are limited and they are not always satisfactory in practical use. Thus, it is desired to develop a lipoperoxide formation inhibitor having a novel structure that can be effectively and widely utilized in the medicinal field.

**OBJECTS OF THE INVENTION**

The main objects of the present invention is to provide novel compounds having a lipoperoxide formation inhibitory activity and lipoperoxide formation inhibitory preparations containing them as an active component.

SUMMARY OF THE INVENTION

Under these circumstances, the present inventors synthesized a number of novel compounds and tested their antioxidation activity and lipoperoxide formation inhibitory activity, respectively, in order to attain the above object.

As a result, the inventors have succeeded in creating aminocoumaran derivatives having a novel structure of the general formula (I):

Further, it has been found that the novel compounds have activities useful for medicines, for example, strong lipoperoxide formation inhibitory activity and the like. Thus, the present invention has been completed.
